

INCIDENT MANAGER BRIEF — SIA MOP-UP PRIORITISATION (FINAL)

Bansara State, 9-13 March 2026 SIA | All 160 GPS track files + full e-tally | 24-hour mop-up window

1. SITUATION SUMMARY

Full reconciliation across all 32 teams' GPS tracks (929,733 raw points, 117,737 QA-clean) against e-tally, for 2,524 planned settlements.

1,113 settlements confirmed by BOTH e-tally and GPS. 149 were GPS-visited but never reported (a reporting gap, not an access gap). 903 were reported in e-tally with no surviving clean GPS fix nearby (usually GPS data sparsity, not a false report).

359 settlements (14.2%) have NEITHER an e-tally record NOR a GPS-confirmed visit -- this is the corroborated, defensible missed list, roughly half the size of the e-tally-only estimate from the earlier partial analysis.

Local Moran's I on this corroborated indicator flags 87 settlements inside statistically significant missed-clusters (k=8 nearest-neighbour weights, 999 permutations, $p < 0.05$).

Team T25 has full GPS coverage (~3,400 points, all 5 days) but ZERO e-tally rows anywhere in the campaign -- a missing paper-tally-sheet problem for one entire team, not a missed-settlement problem.

Okriba ward (Ilela) looked 100% missing from e-tally in the earlier partial view. With GPS, 32 of its 36 settlements are confirmed visited -- a reporting failure, not a coverage failure. Do not send a mop-up team there; send a data-reconciliation team instead.

2. PRIORITY AREAS FOR THE NEXT 24 HOURS (corroborated missed clusters)

Ward	LGA	Settlements	Missed(both)	Sig.cluster	% missed
Satide	Katsuma	59	25	17	42%
Sashasa	Katsuma	61	21	17	34%
Longoma	Katsuma	50	17	12	34%
Sudefa	Katsuma	35	15	11	43%
Suwade	Katsuma	46	10	8	22%
Sashako	Gwarin	45	12	3	27%

The Katsuma cluster (Satide, Sashasa, Longoma, Sudefa, Suwade, Bazasa, Tasayi) is now the dominant, corroborated priority: all seven wards remain significant after requiring both sources to agree, meaning this is real geographic under-coverage, not a reporting artefact.

Idi-Oro's flagged wards (Bishama, Satita, Okradu, Bayoyi) are lower-percentage and more scattered; check for buffer-overlap ties (urban 250m radius) before committing scarce mop-up capacity there ahead of Katsuma.

3. RECOMMENDED ACTIONS (next 24 hours)

1. Deploy available mop-up capacity to the Katsuma cluster first -- it is the only LGA where the corroborated (not just e-tally) missed rate is both high and geographically concentrated.
2. Contact Team T25's supervisor today for the missing paper tally sheets -- do not send a mop-up team anywhere on T25's route until it is confirmed whether settlements were actually missed or just unreported.
3. Route the 149 statewide GPS-confirmed-but-unreported settlements to LGA data-entry teams for same-day tally reconciliation rather than mop-up.
4. Re-verify security classification for the corroborated missed settlements not already on the inaccessible list before deploying teams.

4. RISKS AND LIMITATIONS

Raw GPS timestamps have a severe, systemic defect: about 80% of all points carry a date outside the real 5-day campaign window (files span up to 20 days beyond their filename date), so only about 13% of raw points survive QA. The corroborated missed list is the best available answer, not a fully GPS-verified one.

A cluster finding is an area-level pattern only -- it does not confirm any single settlement was unvisited or that any individual child was missed.

logger_id is reused across days without a stable per-device key (212,151 timestamp collisions resolved by keying on full fix content); flag to the logger fleet manager for the next round.
